

ABSTRACT OF THE DISCLOSURE

Disclosed are a communication control apparatus and a communication control method for re-establishing the connection of a line when a user disconnects the  
5 line by mistake during the transmission of data, and a storage medium therefor.

According to the present invention, when a lower layer is disconnected while data is being transmitted to another apparatus, an upper layer is so controlled  
10 that it maintains a session for a predetermined period of time, and when a line connection is re-established within the predetermined period of time, establishes a connection for the transmission of data.
